

Secure Messaging **Overview**

Securely and easily send, receive, track and control communications on any device.

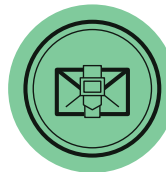

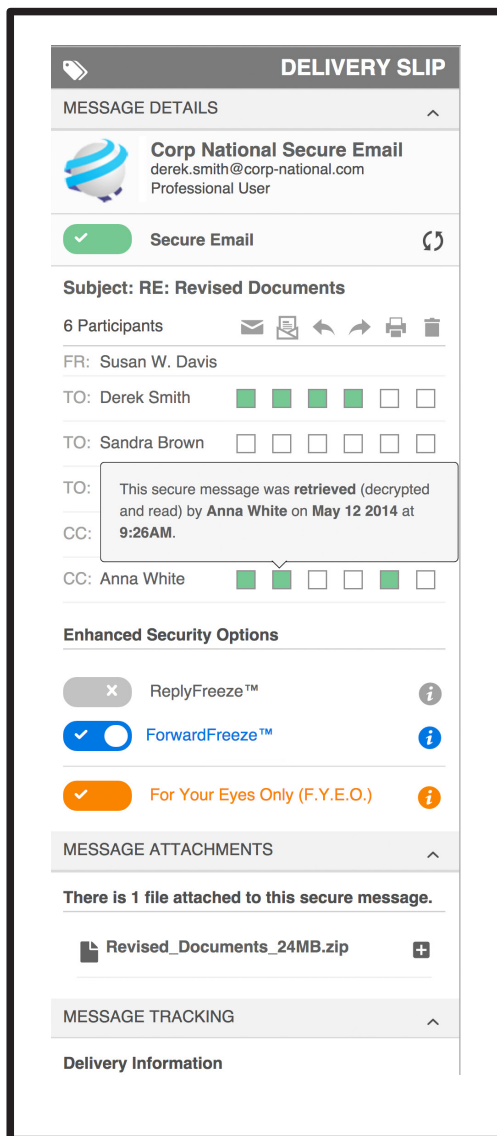

Businesses of every size, in every industry – both regulated and non-regulated – recognize the critical value of Secure Messaging for email encryption, compliance and control.

Secure Messaging

Secure Messaging is a simple yet powerful encryption and message control tool that enables businesses to easily protect and manage their email. Secure Messaging works within your existing email system as well as on any device including tablets and smartphones.

Secure Communications Simplified

Easily and securely send, receive and track messages and attachments right from your existing email such as Outlook, Office 365 or Gmail.

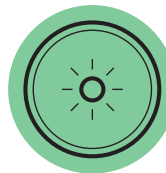

Prevent Data Loss

Revoke a message sent in error or set it to expire at a later date. Secure Messaging works with any existing data leak prevention (DLP) engine and offers “intelligent content scanning” based on security policies.

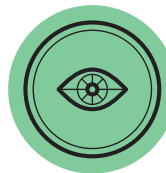

Secure Large File Sharing

Secure Messaging enables users to securely share large file attachments of up to 5GBs.

Advanced Message Control

Secure Messaging’s “Delivery Slip” notifies users in real time when an email is received and read and enables them to control whether it can be replied to or forwarded. Users can apply password protection for sensitive information.

Customizable Secure Environment

Secure Messaging provides businesses with a dedicated “slice” of the secure cloud and is fully customizable to security policies. Every Secure Messaging portal is custom-branded and encrypted for a seamless user experience.

Seamless Integration

Secure Messaging quickly and seamlessly integrates into existing email, DLP and archiving systems.
